

## Design technician

A design technician works on the conception of products and develops manufacturing processes for customers. They can also work on new production methods for the factory, as welle as participating to projects of new production machines.

The design technician needs to have extensive knowledge in drawings and industrial conception, general mecanics and material science. They need to be organised, tidy, and capable of juggling several projects at a time. Lastly, they need to be conscientiousand precise, rigorous, and aware of quality and reliability in the conception of productions.

## Engineering

## Methods maintenance manager

The methods maintenance manager supervises two activities. Methods, which consist of describing the production processes as well as defining the production tunings in order for the production to be efficient and of quality; and maintenance, which consists of being in charge of the optimal use of the production equipment and machines.

The methods maintenance manager must have a methods and maintenance diploma. They need to be a good critical thinker, have good deductive skills, and must be a team player. They also need to have good managerial qualities.
